LEARNING OBJECTIVES

1. Introduction
2. CI on μ of a $N(\mu, \sigma^2)$: σ^2 known
3. CI on μ of a $N(\mu, \sigma^2)$: σ^2 unknown
4. CI on μ of any distribution: large-sample
5. CI on σ^2 a normal distribution
6. CI for the proportion p : large-sample

Introduction

CI on μ of a $N(\mu, \sigma^2)$: σ^2 Known

CI on μ of a $N(\mu, \sigma^2)$: σ^2 Unknown

CI on μ of arbitrary distribution

CI on σ^2 of a Normal

CI for p

Summary

- A **confidence interval** estimate for μ is an interval of the form $l \leq \mu \leq u$, where the endpoints l and u are computed from the sample data.
- Because different samples will produce different values of l and u , these end-points are values of random variables L and U , respectively.
- Suppose that we can determine values of L and U such that the following probability statement is true:

$$P(L \leq \mu \leq U) = 1 - \alpha$$

There is a probability of $1 - \alpha$ of selecting a sample for which the CI will contain the true value of μ

Introduction

CI on σ^2 of a Normal

CI for p

Summary

Example

A college admissions director wishes to estimate the mean age of all students currently enrolled. In a random sample of 20 students, the mean age is found to be 22.9 years. From past studies, the standard deviation is known to be 1.5 years, and the population is normally distributed. Construct a 90% confidence interval of the population mean age.

Solution: We have $\bar{x} = 22.9$; $\sigma = 1.5$; $1 - \alpha = 0.9$;

$$\alpha = 0.1 \Rightarrow z_{\alpha/2} = \text{NORMSINV}(1 - 0.1/2) = 1.645$$

Introduction

CI on μ of a $N(\mu, \sigma^2)$: σ^2 Known

CI on μ of a $N(\mu, \sigma^2)$: σ^2 Unknown

CI on μ of arbitrary distribution

CI on σ^2 of a Normal

CI for p

Summary

Confidence interval:

$$22.9 - 1.645 \frac{1.5}{\sqrt{20}} \leq \mu \leq 22.9 + 1.645 \frac{1.5}{\sqrt{20}}$$

or

$$22.3 \leq \mu \leq 23.5$$

CI for p

Summary

Theorem

If \bar{x} and s are the mean and standard deviation of a random sample from a normal distribution with unknown variance σ^2 ,

- A $(1 - \alpha)$ -percent confidence interval on μ is given by

$$\bar{x} - t_{\alpha/2, n-1} \frac{s}{\sqrt{n}} \leq \mu \leq \bar{x} + t_{\alpha/2, n-1} \frac{s}{\sqrt{n}}$$

- A $(1 - \alpha)$ upper-confidence bound for μ is

$$\mu \leq \bar{x} + t_{\alpha, n-1} \frac{s}{\sqrt{n}}$$

$$= \text{TINV}(\alpha, n-1)$$

- A $(1 - \alpha)$ lower-confidence bound for μ is

$$\bar{x} - t_{\alpha, n-1} \frac{s}{\sqrt{n}} \leq \mu$$

Introduction

CI on μ of a $N(\mu, \sigma^2)$: σ^2 Known

CI on μ of a $N(\mu, \sigma^2)$: σ^2 Unknown

CI on μ of arbitrary distribution

CI on σ^2 of a Normal

CI for p

Summary

Example

An article in the journal *Materials Engineering* describes the results of tensile adhesion tests on 22 U-700 alloy specimens. The population is normally distributed. The load at specimen failure is as follows:

19.8 10.1 14.9 7.5 15.4 15.4 15.4 18.5 7.9 12.7 11.9 11.4 11.4
14.1 17.6 16.7 15.8 19.5 8.8 13.6 11.9 11.4

Find a 95% CI on μ .

Solution: We have $\bar{x} = 13.71$ and $s = 3.55$

$$\alpha = 1 - 0.95 = 0.05; \quad n = 22 \Rightarrow t_{\alpha/2, n-1} = \text{TINV}(0.05, 21) = 2.08$$

$$\text{A 95\% CI on } \mu \text{ is } \bar{x} - t_{\alpha/2, n-1} s / \sqrt{n} \leq \mu \leq \bar{x} + t_{\alpha/2, n-1} s / \sqrt{n}$$

$$12.14 \leq \mu \leq 15.28$$

Introduction

CI on μ of a $N(\mu, \sigma^2)$: σ^2 Known

CI on μ of a $N(\mu, \sigma^2)$: σ^2 Unknown

CI on μ of arbitrary distribution

CI on σ^2 of a Normal

CI for p

Summary

Theorem

When n is large, the quantity

$$\frac{\bar{X} - \mu}{S / \sqrt{n}}$$

$n \geq 40$

has an approximate $N(0, 1)$. Consequently,

$$\bar{x} - z_{\alpha/2} \frac{s}{\sqrt{n}} \leq \mu \leq \bar{x} + z_{\alpha/2} \frac{s}{\sqrt{n}}$$

is a **large sample confidence interval** for μ , with confidence level of approximately $(1 - \alpha)$.

ARBITRARY DISTRIBUTION: A LARGE-SAMPLE

Introduction

CI on μ of a $N(\mu, \sigma^2)$: σ^2 Known

CI on μ of a $N(\mu, \sigma^2)$: σ^2 Unknown

CI on μ of arbitrary distribution

CI on σ^2 of a Normal

CI for p

Summary

Example

A sample of fish was selected from 53 Florida lakes and mercury concentration in the muscle tissue was measured (ppm). The mercury concentration values are

1.230	0.490	0.490	1.080	0.590	0.280	0.180	0.100	0.940
1.330	0.190	1.160	0.980	0.340	0.340	0.190	0.210	0.400
0.040	0.830	0.050	0.630	0.340	0.750	0.040	0.860	0.430
0.044	0.810	0.150	0.560	0.840	0.870	0.490	0.520	0.250
1.200	0.710	0.190	0.410	0.500	0.560	1.100	0.650	0.270
0.270	0.500	0.770	0.730	0.340	0.170	0.160	0.270	

Find an approximate 95% CI on μ .

Solution: We have $\bar{x} = 0.5250$ and $s = 0.3486$

$$\alpha = 1 - 0.95 = 0.05; \quad z_{\alpha/2} = 1.96$$

Introduction

Theorem

EXAMPLE 8-6 Detergent Filling

An automatic filling machine is used to fill bottles with liquid detergent. A random sample of 20 bottles results in a sample variance of fill volume of $s^2 = 0.0153$ (fluid ounce)². If the variance of fill volume is too large, an unacceptable proportion of bottles will be under- or overfilled. We will assume that the fill volume is approximately normally distributed. A 95% upper confidence bound is found from Equation 8-26 as follows:

$$\sigma^2 \leq \frac{(n - 1)s^2}{\chi_{0.95, 19}^2}$$

$$\sigma^2 \leq \frac{(19)0.0153}{10.117} = 0.0287 \text{ (fluid ounce)}^2$$

CI on σ^2 of a Normal

CI for p

Summary

Theorem

Normal approximation

If n is large, the distribution of

$$Z = \frac{X - np}{\sqrt{np(1-p)}} = \frac{\hat{P} - p}{\sqrt{\frac{p(1-p)}{n}}}$$

is approximately $N(0, 1)$.

We can find $z_{\alpha/2}$ such that $P(-z_{\alpha/2} \leq \frac{\hat{P} - p}{\sqrt{\frac{p(1-p)}{n}}} \leq z_{\alpha/2}) \approx 1 - \alpha$

or

$$P(\hat{P} - z_{\alpha/2} \sqrt{\frac{p(1-p)}{n}} \leq p \leq \hat{P} + z_{\alpha/2} \sqrt{\frac{p(1-p)}{n}}) \approx 1 - \alpha$$

CI for p

Summary

Theorem

CI for p

Let \hat{p} is a point estimation for the proportion p of the population based on a random sample of size n , an approximate $(1 - \alpha)$ -confidence interval on p is

$$\hat{p} - z_{\alpha/2} \sqrt{\frac{\hat{p}(1 - \hat{p})}{n}} \leq p \leq \hat{p} + z_{\alpha/2} \sqrt{\frac{\hat{p}(1 - \hat{p})}{n}}$$

Remark: $n \hat{p} > 5$ and $n(1 - \hat{p}) > 5$

Introduction

CI on μ of a $N(\mu, \sigma^2)$: σ^2 Known

CI on μ of a $N(\mu, \sigma^2)$: σ^2 Unknown

CI on μ of arbitrary distribution

CI on σ^2 of a Normal

CI for p

Summary

Example

In a survey of 1219 U.S. adults, 354 said that their favorite sport to watch is football. Construct a 95% confidence interval for the proportion of adults in the United States who say that their favorite sport to watch is football.

Solution: The point estimation for p :

$$\hat{p} = \frac{354}{1219} \approx 0.29$$

Because $n\hat{p} \approx 354 > 5$ and $n(1 - \hat{p}) \approx 865 > 5$, a 95% CI for p is:

$$0.29 - 1.96\sqrt{\frac{0.29(1-0.29)}{1219}} \leq p \leq 0.29 + 1.96\sqrt{\frac{0.29(1-0.29)}{1219}}$$

$$0.265 \leq p \leq 0.315$$
